---

DO ONLY 4 PROBLEMS OF THE 6. PRINT NAME ON EACH SHEET. Work must be presented in a neat and logical fashion to receive credit. Do not leave any gaps. State clearly any theorems used in proofs.

---

1. Let  $F$  be a closed subset of the reals  $\mathbb{R}$  with the usual topology. Show  $F$  is a countable union of compact sets.
2. Let  $E$  be a nonempty subset of a metric space. State the definition of the distance  $\rho_E(x)$  of a point  $x$  to  $E$ . Characterize  $\overline{E}$  in terms of  $\rho_E$ , where  $\overline{E}$  is the closure of  $E$ .
3. (a) Let  $f$  be a continuous function from a compact metric space  $X$  into a metric space  $Y$ . Prove  $f(X)$  is compact.  
(b) Assume the setting in (a) with the further assumption that  $Y$  is the reals with the usual topology. Show that  $f$  assumes maximum and minimum values on  $X$ .
4. Let  $f$  be a continuous map of a metric space  $X$  into a metric space  $Y$ .  
(a) Show that if  $f$  is NOT uniformly continuous on  $X$ , then for some  $\varepsilon > 0$  there are sequences  $\{p_n\}, \{q_n\}$  in  $X$  such that  $d_Y(f(p_n), f(q_n)) > \varepsilon$  for each  $n$  but  $d_X(p_n, q_n) \rightarrow 0$ .  
(b) Assume that  $X$  is compact. Show, using (a), that  $f$  is uniformly continuous on  $X$ .
5. Let  $\{x_n\}$  be a sequence of points in  $(a, b)$  and let  $\{c_n\}$  be a sequence of positive numbers such that  $\sum c_n$  converges. Define
$$f(x) = \sum_{n: x_n < x} c_n, \quad a < x < b,$$
where the summation is understood as follows: sum over those indices  $n$  for which  $x_n < x$ . If there are no points  $x_n < x$ , define the sum to be zero.  
(a) Show  $f(x-) = f(x)$  for each  $x$  in  $(a, b)$ .  
(b) Show  $f(x_n+) - f(x_n-) = c_n$ , for each  $n$ .
6. Suppose  $f$  is continuous on  $[0, \infty)$ , differentiable on  $(0, \infty)$ ,  $f(0) = 0$  and  $f'$  is monotonically increasing. Define  $g$  on  $(0, \infty)$  by  $g(x) = f(x)/x$ ,  $x > 0$ . Prove  $g$  is monotonically increasing.
